

ABSTRACT OF THE DISCLOSURE

A tool box includes a main body formed with a plurality of receiving recesses for receiving and locking a plurality of sockets. Each of the receiving recesses has a first wall formed with a first locking portion and a second wall formed with a second locking portion. Each of the sockets has a first end locked on the first locking portion of the respective receiving recess and a second end locked on the second locking portion of the respective receiving recess. Thus, the first locking portion and the second locking portion form a three-point locking effect, so that the socket is positioned in the respective receiving recess rigidly and stably without sway.
